INSTITUTE FOR DEFENSE ANALYSES
730 E.Glebe Rd
Alexandria, VA 22305

The Institute for Defense Analyses is a nonprofit corporation that operates three Federally Funded Research and Development Centers. Its mission is to answer the most challenging U.S. security and science policy questions with objective analysis, leveraging extraordinary scientific, technical, and analytic expertise.

About This Publication
This work was conducted by the Institute for Defense Analyses under contract HQ0034-19-D-0001, project FN-6-5073, "Medical CBRN Defense Analyses" for the U.S. Army Office of The Surgeon General (OTSG) Executive Agent. The views, opinions, and findings should not be construed as representing the official position of either the Department of Defense or the sponsoring organization.

Acknowledgments:
The authors wish to acknowledge the significant contributions to this document made by members of NATO's Medical Training Panel, CBRN Medical Working Group, Biological Medical Panel, and other national NATO CBRN medical experts. Particular thanks go to the many physicians who created and reviewed the simulated patient files. The authors also thank Catherine Scheible, Julia Burr and LTC Daniel Aron (MILMED COE) for their guidance on and thorough reviews of this handbook, Megan Malone for her careful editing, and Amberlee Mabe-Stanberry for her masterful production work.

Handbook for NATO Exercises with CBRN Medical Training

Volume 2

CBRN Simulated Patient Files

NATO CBRN Medical Training Panel

Luke A. LaViolet
Janet C. Marroquin Pineda
Sean M. Oxford

This page is intentionally blank.

Acknowledgements

This Handbook was developed by the chemical, biological, radiological, and nuclear (CBRN) Medical Training Panel, which serves as a liaison between the Joint CBRN Defence Capability Development Group's Training and Exercise Panel and the CBRN Medical Working Group.

The CBRN Medical Training Panel thanks the members of the CBRN Medical Working Group, Biological Medical Panel, and other Allied NATO CBRN medical experts who created and reviewed the CBRN simulated patient files. The CBRN Medical Training Panel also thanks all who participated in Exercise Clean Care 2022 for the opportunity to test and improve many simulated patient files.

Finally, the CBRN Medical Training Panel thanks the staff of the Institute for Defense Analyses for imagining and then creating this Handbook.

Organisation of the Handbook's Two Volumes

Volume 1: Main Body contains special CBRN medical considerations to help with exercise planning, preparation, and execution throughout the formal North Atlantic Treaty Organization (NATO) exercise process, as described in *Bi-Strategic Command Collective Training and Exercise Directive 075-003*.

Volume 2: Simulated Patient Files (this volume), contains CBRN simulated patient files (also called patient cards) with medical information generated by a subject matter expert (SME) in the specific causative agent or effect.

Page left intentionally blank.

Table of Contents

Page left intentionally blank.

1. Introduction

A. Purpose of this Handbook

This handbook is designed to equip the individuals planning and executing a NATO exercise with the resources to accomplish cross-disciplinary chemical, biological, radiological, and nuclear (CBRN) defence and medical training, whether or not CBRN medical support is a primary focus of the exercise. For such training to be successful, a level of CBRN medical expertise is required for certain exercise planning tasks, but the individuals responsible for those tasks are often experts in areas other than CBRN medical support and lack ready access to CBRN medical expertise.

B. Simulated Patient Files

Volume 2 contains the CBRN simulated patient files. For all other contents of this handbook, see Volume 1. This volume contains over 100 template CBRN simulated patient files, with medical information generated by a SME in the specific causative agent or effect. CBRN simulated patient files must be modified by the MEL/MIL scripters to include the relevant incident-specific background information on the patient. Table 1 lists the patient cards that are contained in Chapter 2 of this volume.

Table 1. List of CBRN Simulated Patient Files

Index	CBRN Simulated Patient File
A1	Nerve Agent Survivor—Mild

		S	Sweating

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

1) Personal protective equipment for all personnel
2) Self-and buddy aid: autoinjector administration, 1 Autoinjector (220 mg obidoxime/2 mg atropine)
3) Decontamination before admission to a medical facility
4) Oxygen administration

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
80	110	90	15/min	95	Alert	4	5	6	

List of injuries (or disease findings):

Upon admission, the cholinergic signs have seized.
Persisting miosis, sweating has stopped
Biological samples are taken and processed accordingly (whole blood).
The point-of-care-diagnostics indicate a normalized AChE activity.
No additional injuries.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1:00H	No further cholinergic signs.
+1D	Che status shows normalized AChE activity, the patient is kept in the hospital for close monitoring and suffers only from slight headaches.
+2D	Specialized analytical laboratories identify the nerve agent. No reoccurence of cholinergic signs. Full recovery.

EXPECTED OUTCOME OF CASE

Full recovery.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Normal AChE activity upon arrival at the hospital (ChE-activity via point-of-care-diagnostics)		

ADDITIONAL COMMENTS including Moulage Information
The first clinical signs, sweating and rhinorrhea, need to be clearly shown. Initial treatment depends only on the cholinergic signs.

S	Normal

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Two CATs applied on right arm and leg, Nasopharyngeal airway inserted and one NA autoinjector given.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
130	60	-	30/min	72	Unresp	4	1	1	

List of injuries (or disease findings):

Multiple dirty shrapnel wounds on right side of face, torso, arm and leg, major bleeding stopped, some oozing still. Crepitation on right chest wall. Blunt trauma on right temple under helmet. Nasopharyngeal airway in place, nearly obstructed with secretions, severe distress, breath sounds absent on right, ice cold periphery.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+0:45H	Cyanotic, agonal breathing, cardiovascular collapse due to hypovolemia and tension pneumothorax. Thoracocentesis is needed asap, otherwise cardiac arrest and CPR with poor outcome.
+0:50H	Saturation low, systolic BP 70, unconscious, copious secretions. Chest tube and intubation (RSI) needed, airway toilet. Two large bore IV-lines, volume replacement and vasopressor therapy. High airway resistance, more atropine (and oxime) needed. A-line and eFAST if available.
+1:00H	Tension hemo-pneumothorax resolved with 600 ml blood in container. Sats up to 90% with mechanical ventilation, moderate PEEP and FiO2 100%. HR 90, BP 90/50 with vasopressors and fluids. Hb 78, pH 7,15, BE -5,0. Consider TXA and RBCs, if available. Central line, Chest X-ray, antibiotic, more atropine
+2:00H	Airway resistance and secretions diminished. Sats 94%, HR 90, ABP 110/70, Hb 75 (no RBCs), pH 7,26, BE -3,5. Pupil anisocoria, right large, left constricted. Urgent CT, if available (traumatic SDH). Neurosurgical consultation and preparations for transfer to Role 3. Sedation and ventilator settings accordingly.
+5:00H	Hemicraniectomy and vascular surgical evaluation of right arm. Debridement of major wounds. Post op ICU. Continuous EEG monitoring.
+3D	Weaning protocol started.

EXPECTED OUTCOME OF CASE

Patient is discharged after two weeks with some sensomotor defects of right hand and fingers, clumsiness of left extremities and minor neurophysiological sequelae.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
		 

ADDITIONAL COMMENTS including Moulage Information

Shrapnel most likely contaminated by NA. How to deal with that during medical management and surgical procedures?

Two CATs applied on right arm and leg, Nasopharyngeal airway inserted

Multiple dirty shrapnel wounds on right side of face, torso, arm and leg.
Major bleeding stopped, some oozing still.
Crepitation on right chest wall.
Blunt trauma on right temple under helmet.
Nasopharyngeal airway in place, nearly obstructed with secretions.
Severe distress.
Ice cold periphery.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

1) Personal protective equipment for all personnel
2) Self-and buddy aid: autoinjector administration, 1 AI (220 mg obidoxime/2 mg atropine), 2 AI (each 2 mg of atropine)
3) Decontamination before admission to a medical facility
4) Oxygen administration

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
50	90	60	5/min	87	Pain	2	2	3	

List of injuries (or disease findings):

Upon admission, heart rate and blood pressure have ameliorated, however, respiratory impairment persists.
Bronchoconstriction, bronchorrhea, convulsions.
Immediate intubation and mechanical ventilation are required.
Biological samples are taken and processed accordingly (whole blood).
The ChE point-of-care-diagnostics show a suppressed AChE activity.
The patient suffers from aspiration.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+0h	Intubation and mechanical ventilation, further atropine administration and 750 mg/d obidoxime administration via syringe pump, ChE point-of-care-diagnostics show total AChE suppression, the benzodiazepines that are administered for intubation lead to a cessation of convulsions
+2h	Chest x-ray indicates aspiration in the right basal lobe, antibiotics are administered, bronchoscopy is performed.
+1d	The ChE status shows reactivatability of inhibited AChE, and inhibitory activity of the patient´s plasma, obidoxime is continued. Atropine is still necessary to threat cholinergic crisis.
+2d	Persisting inhibitory activity of the patient´s plasma, obidoxime is continued to protect reactivated and newly synthesized AChE. Specialized analytical laboratories identify the nerve agent.
+14d	Discontinuation of obidoxime due to lack of inhibitory activity of the patient´s plasma. Atropine is also discontinued due to the lack of cholinergic signs.
+21d	Extubation and discharge from ICU.

EXPECTED OUTCOME OF CASE

Full recovery after rehabilitation.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Suppressed AChE activity upon arrival at the hospital (ChE point-of -care-diagnostics) The inital ChE status shows reactivatability of inhibited AChE and inhibitory activity of the patient´s plasma	Chest x-ray indicates aspiration pneumonia	

ADDITIONAL COMMENTS including Moulage Information
The first clinical signs, sweating and rhinorrhea, need to be shown clearly. Aspiration should be indicated.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Two NA-autoinjectors given at scene by buddy-aid and medic in 5 min interval. Third AI during decontamination.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
48	80	40	8/min	76	Unresp	4	2	2	Vomiting, convulsing

List of injuries (or disease findings):

Airway compromised with secretions, vomit and blood, breathing severely distressed and respiratory drive diminished, HR and BP low, unconscious, extremities twitching, tongue bitten, pupils constricted

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+0:30H	Signs and symptoms as above: Suction, oxygen mask, IV-line, more atropine+BZP
+0:45H	Rapid sequence intubation (RSI) using videolaryngoscope if available. Preferred anaesthetics ketamine and rocuronium, otherwise expect haemodynamic collapse and need for inotropes/vasopressors, even CPR. Manual ventilation difficult, more atropine needed. Prior aspiration evident. If RSI is not possible or successful (Role 1?), airway management with laryngeal mask. This indicates poor prognosis.
+1:00H	Mechanical ventilation and bronchoscopy with suction and lavation, otherwise oxygen saturation is not improving. Ventilator settings with highest tolerable PEEP and prolonged expiration time. Propofol and norepinephrine infusions. More atropine, consider also atropine infusion and alternative oxime. Arterial line if available. Repeated blood gases. HR 60, BP 85/40. pH 7.18, pO2 6.0, pCO2 7.7
+2:00H	Frequent airway toilet, central line, chest x-ray, urinary catheter. Airway pressure is decreased and secretions diminished, if total dose of atropine is >20 mg. Chest x-ray shows bilateral infiltrates, no complications. Broad spectrum antibiotic needed. HR 80, ABP 90/60. pH 7.22, pO2 6.5, pCO2 7.4.
+6:00H	Persistent ventilatory failure and poor oxygenation. High PEEP and FiO2 still needed. Haemodynamic instability. Volume replacement and vasopressors needed. Anticonvulsive therapy adequate? Consider EEG and HR-CT if available. EEG shows continuous epileptic activity. HR 110-130, ABP 80-100/50-70. pH 7.24, pO2 6.9, pCO2 7.1.
+12:00H	Stable haemodynamics with vasopressors. Ventilator settings still high. Need for atropine diminished. Oxime still continued. Antithrombotic therapy. Transfer to higher echelon (Role 3). HR 100-120, ABP 110/70, pH 7.28, pO2 8.0, pCO2 6.4.
+2D	Haemodynamic stability. Ventilator settings moderate. EEG normalized. Substantial anticonvulsive therapy.
+4D	Starting weaning protocol.

EXPECTED OUTCOME OF CASE

Patient survives the exposure if medical care during the first 60 minutes is successful and aggressive enough (airway management and toilet, dosing of atropine, ventilatory therapy). Neurological and psychological outcome remains uncertain.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

ADDITIONAL COMMENTS including Moulage Information

Severe, mostly inhalational NA exposure. No conventional trauma.

Airway compromised with secretions, vomit and blood.
Breathing severely distressed and respiratory drive diminished.
Unconscious.
Extremities twitching.
Tongue bitten.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Undressed and self-decontaminated with RSDL. During that starts to shiver uncontrollably and falls to ground. No medical treatment so far.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
55	95	58	10/min	92	Pain	4	2	2	

List of injuries (or disease findings):

Unconscious, pupils constricted, twitching heavily and starts to convulse and vomit after vitals.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+30min	Deeply unconscious, convulsing subsided. Mouth full of vomit and secretions. Resp 6, agonal pattern, central cyanosis, sats -. HR 34, BP 65/35. Urgent need for airway management and ventilatory support. Aggressive dosing of atropine and first doses of oxime and BZP. Inotrope and vasopressor needed.
+45min	Decontamination inadequate, minor symptoms in medical personnel. Accessory decon needed. Replacement of medical team? Airway secured? If not, cardiac arrest. Manual ventilation difficult, still hypoxic (FiO2 100%). HR 28, BP 60/-
+60min	Decon completed. Atropine dose >>10 mg. HR 20-30, multifocal extrasystolia, a. Car. -, start CPR with epinephrine and more atropine.
+1.25h	a. Car. +, NIBP failed, HR 40-50, multiple ventricular extras, pupils medium sized.
+1.5h	ETT obstructed => tube changed => persistent VF, CPR with several DC shocks.
+1.75h	CPR stopped.

EXPECTED OUTCOME OF CASE

Patient dies due to massive VX exposure contributed by airway problems.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

ADDITIONAL COMMENTS including Moulage Information

First impression of worried well and delay of starting adequate medical treatment. Severe dermal exposure to non-volatile NA. Incomplete self-decontamination before arrival at medical facility. Medical personnel contaminated and having minor symtoms. How to proceed? Tactical decision making during medical treatment of T1 patient.

	E **E** Sweaty face, cold and clammy extremities	**S**	Slightly increased
		S	Diaphoretic

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

CAT on left thigh and some dressings on left buttock by buddy-aid. Morphine autoinjector by medic. Hurried to Role 1+ inside the camp.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
110	70	30	30/min	76	Pain	4	2	2	

List of injuries (or disease findings):

Bleeding from left buttock. Unconscious. Breathing distressed. Secretions on corner of mouth and nostrils. Pupils constricted. Twitching of upper extremities and facial muscles. Defecated. Skin cold and pale. No decontamination.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+0:20H	Signs and symptoms as above. Hypovolemic shock with NA intoxication. CAT in place. Needs immediate respiratory and circulatory support with secured airway (ETT preferred). Aggressive dosing of atropine with oxime and BZP. Medical team wearing gas masks or respirators.
+0:30H	Intubation difficult due to secretions and anatomy. Severe desaturation and cyanosis. LMA as a secondary choice. Manual ventilation very difficult due to secretions and resistance. Consider surgical airway. HR 50-70, irregular with extras. BP 60/-, Sats ??, vasopressor and more atropine needed
+0:45H	LMA useless, viscous secretions, surgical airway needed. If total dose of atropine > 10 mg, airway resistance slightly decreasing (contributed by epinephrine?), HR 70-90, more extras, BP 80/40. TXA?
+1:00H	If crico ok, still time to play, otherwise myocardial ischemia and persistent VF degenerating to cardiac arrest. A-line? Blood gases: pH 6,9, BE -6,5, pO2 6,0, pCO2 7,2. Hb 68. HR 110, BP 100/70=>dressings soaking. Diffuse bleeding needing surgical intervention. RBCs?, Antibiotic?
+1:30H	Damage control surgery, if available. Fecal contamination. Several shell fragments removed. Heavy bleeding continues. Proper airway toilet difficult. HR 110-130, BP 90/50. pH 7,1, BE -7,0, pO2 7,2, pCO2 6,6. Hb 64. Consider freeze-dried plasma/cryo.
+2:30H	Rapid debridement and packing. Severe coagulopathy and septicemia. HR 140-160, irregular. BP 65/30. pH 6,9, BE -9,0, pO2 7,2, pCO2 6,9. Hb 74 after several units of RBCs. Vasopressors ineffective, consider buffer. Too unstable to be transferred.
+3:30H	Circulatory decline. HR 40-50, VES, BP 30/-. pH 6,7, BE -12,0, pO2 7,7, pCO2 5,0. Hb 80. Epinephrine dosages and CPR.
+3:45H	VF

EXPECTED OUTCOME OF CASE

Patient dies at medical facility to combination of hypovolemic shock due to traumatic bleeding and severe NA intoxication.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

ADDITIONAL COMMENTS including Moulage Information

Personnel wearing gas masks. Chaotic situation and patient brought to medical facility without decontamination.

Bleeding from left buttock.
Unconscious.
Breathing distressed.
Secretions on corner of mouth and nostrils.
Twitching of upper extremities and facial muscles.
Defecated.
Skin cold and pale.
CAT on left thigh and some dressings on left buttock.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Immediate decontamination
Pressure dressing to right thigh (possible tourniquet)
Decontamination for persistent blister agent

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
98	119	82	20	97	A	4	5	6	

List of injuries (or disease findings):

* Fragmentation injury to right lower limb
* Large fragmentation injury close to R femoral artery

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1:00H	Control bleeding from fragmentation injury
+3:00H	Develops red/swollen eyelids, moderate ocular pain and multiple red skin lesions/blisters.
+12:00H	Develops runny nose, sneezing, hoarse voice, cough

EXPECTED OUTCOME OF CASE

Patient has potential cat heam to right thigh. Can be managed by pressure dressing. This is a challenge for wound decontamination due to risk of re-bleeding. Gross contamination requiring decontamination.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Suspected chemical agent exposure. Undressed and decontaminated thoroughly. No medical treatment.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
55	110	70	20	99	A	3	5	6	

List of injuries (or disease findings):

Photophopia and pain on both eyes. Obvious conjunctivitis. Nauseous and vomits a few times. Some redness and itching on forehead, cheeks, neck and palms.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+ 2:00H	Severe pain on eyes, swelling of eyelids, redness and dermal swelling of face and neck, hoarse voice. HR 80, BP 150/85, resp 24, sats 99, GCS 14. Iv-line and some cristalloid, pain management with NSAID and/or opioid, consider antiemetics.
+ 4:00H	Still some eye pain, headache and fatique. Major swelling of eyelids, plepharospasm. Epistaxis and hacking cough. Burning sensation of neck and palms, redness of forearms, elbows and armpits. HR 74, BP 130/65, resp 28, sats 99, GCS 14. Cont. analgesics, consider TXA, sterile dressings/burn bandages
+ 8:00H	Severe oedema of eyelids, corneal damage and loss of sight. Cough with bloody sputum, sore throat, loss of voice. Mild blistering of forehead and neck, spreading redness in both arms, armpits and groin. HR 90, BP 140/86, resp 30, sats 97, CGS 14. Oxygen, analgesia, more dressings, antibacterial ointment, antibiotic eyedrops.
+ 12:00H	Increasing shortness of breath, bloodstained productive cough, inspiratory wheeze, abundant blistering on face and neck, some blistering on arms, armpits and groin. HR 100, BP 110/55, resp 34, sats 94 w. O2, GCS 13. Airway management and mechanical ventilation, circulatory support. Antibiotic. Transfer to Role 3?
+ 1D	Airway secured with ETT, frequent airway toilet, CXR: bilateral oedema; high PEEP and FiO2. Sedation, circulatory support, ABP and CVP. Antibiotic cont., antitrombotics?
+ 2D	Severe pulmonary oedema; intermittent prone positioning, sudden increase in airway pressure and desaturation due to bronchial obstruction by pseudomembrane; emergency bronchoscopy.
+ 4D	Some improvement in oxygenation. Sudden metabolic acidosis, lactatemia and oligouria, S-CK and S-myogl. high, capillary refill delayed in both hands; immediate escharotomy of both forearms.
+ 6D	Significant leucopenia, fever and increased CRP; microbial cultures (blood, urine, bronchi), replace vascular catheters, broad-spectrum antibiotic, consider antifungal.

EXPECTED OUTCOME OF CASE

Patient survives. One year after: Some residual scarring of right cornea, visual aquity o.dx. diminished. Bronchiectasia and stricture of trachea needing frequent dilatations.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

After removal from area of suspected contaminated, undressed and "decontaminated" with water before dressing the wounds.
During the transport medic puts on an iv-line with some cristalloid and gives one dose of fentanyl after which the patient vomits.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
120	110	70	28/min	92	Verbal	3	4	5	

List of injuries (or disease findings):

Arrival at MTF 90 min after the incident. Decontamination with soap and water. Multiple wounds and lacerations by shrapnel and glass over the right side of face, neck, arm, torso and leg. Body armour and helmet have given some protection. Right shoulder dislocated and very painful. Right eardrum perforated. Conjunctivitis, eyelids swollen. Redness of face, neck and chest. Nauseous and coughing.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+2:00H	Coughing and nose bleed. HR 104, BP 116/74, Resp 30, Sats 94 with O2. Photophobia and severe eyepain. Oedema of face and neck. Multiple contaminated shrapnels in wounds. Urgent debridement and airway protocol needed. Pain management?, antiemetics?, TXA?, antibiotics?
+4:00H	Airway secured and patient sent to Role 2 (if not already there). HR 100, BP 112/68, ventilated, Sats 96, sedated. Hb 98,
+8:00H	Debridement done and facial wounds sutured. Chest X-ray shows bilateral inflitrates and anterior shoulder dislocation. Major swelling of face and neck. Some blisters. HR 108, BP 96/68, Sats 90, Temp 38,4 C. Hb 82, Leuc 10.2, Trom 124, pH 7.24, Lact 2.6
+12:00H	Severe aspiration pneumonia and advancing pulmonary oedema. Haemodynamic instability. HR 120, BP 90/60 (with fluids and vasopressors), Sats 86 (FiO2 100%). Large bullae on neck, blisters on face, chest, armpits and arms. Role 3/ICU needed.
+1D	Lung protective ventilation with high PEEP, circulatory support (invasive haemodynamic monitoring), frequent diagnostic bronchoscopy, HR 110-130, MAP 50-60, CVP 14-18, Sats 82-88, pH 7.3, pO2 6.7, pCO2 7.2, Lact 3.6, Hb 78, Leuc 14.2, Trom 98, CRP 260, HR-CT: consolitated parenchyma and large effusions l.a.
+2D	Intensive care cont. Consultation of ophthalmologist, pulmologist and plastic surgeon. Consider tracheostomy and prone positioning. 24% BSA damaged. Need for redo debridement?

EXPECTED OUTCOME OF CASE

Weaned on day 18. Transferred to pulmonary ward on day 25. Discharged on day 48. Skin lesions not completely healed yet. Suffering from COPD-like symptoms. Lung capacity diminished and exercise tolerance poor. Visual acuity normal.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Routine labs normal		 

ADDITIONAL COMMENTS including Moulage Information
Multiple wounds and lacerations by shrapnel and glass over the right side of face, neck, arm, torso and leg. Right shoulder dislocated and very painful. Right eardrum perforated. Conjunctivitis, eyelids swollen. Redness of face, neck and chest. Nauseous and coughing.

Large ragged wound on left mid-thigh. Lacerated femoral artery. No active bleeding (CAT). Penetrating wound on left arm. No arterial bleeding after releasing CAT. Wound flushed and packed before surgery. Left eardrum perforated. Exposed to phosgene (chem detector).

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1:00hr	List of injuries as above. O2-mask, iv-lines, TXA, antibiotic, FFP. eFAST neg., Hb 90, pH 7.24, BE -3.5. Pain management continued (oxycodone/morphine). Evacuation to Role 2 for DCS.
+3:00hr	At Role 2; DCS: Debridement of both shrapnel wounds, vascular shunt of left femoral artery, fasciotomy. Intubated, Sats 98% (FiO2 100%), HR 124, BP 100/55, CXR normal
+5:00hr	Left intubated under sedation. Sats 94% (FiO2 50%, PEEP 5 cmH2O), pO2 9.5, pCO2 4.8, pH 7.30, BE -2.0, Hb 78. HR 120, BP 118/62, Two units of whole blood.
+8:00hr	Sats 90% (FiO2 80%, PEEP 10), pO2 7.5, pCO2 5.6, pH 7.28, BE -1.5, HR 125, BP 110/64, left leg cold, no pulse on foot. Prepare to evacuate to Role 3 for vascular surgery and intensive care.
+12:00hr	At Role 3; Second look operation by vascular surgeon. Bypass with vein graft. Sats 80% (FiO2 100%, PEEP 12), pO2 6.0, pCO2 6.5, pH 7.16, BE -4.0, HR 130, ABR 120/75 (norepinephrine), Hb 90, leuc 12.0, Trom 90, Myogl 1200 ug/l, Krea 120 umol/l, CRP 140. HR-CT: large consolidated areas and pleural effusions on both lungs
+1d	Lung protective ventilation with high PEEP needed, FiO2 80 %. Sats 88%, pO2 7.2, pCO2 6.0, pH 7.34, BE 0.2. Forced alkaline diuresis. HR 90, ABP 116/78 (norepinephrine infusion), wide spectrum antibiotic, antitrombotic medication/LMWH
+2d	HR-CT: consolidations unchanged, pleural fluid on right side. Consider pleurocentesis/chest tube. Sats 90%, pO2 7.3, pCO2 6.4, pH 7.38, BE 1.0, ABP 110/72, Hb 94, Myogl 600, Krea 128, CRP 120. Left leg warm
+5d	HR-CT: consolidations diminished, pleural fluid drained, Sats 94%, pO2 7.8, pCO2 5.8, pH 7.36, BE 2.0, Myogl <100, Krea 90, CRP 60. Consider suturing of fasciotomies. Forced alkaline diuresis discontinued.

EXPECTED OUTCOME OF CASE

Fasciotomies sutured at Day 6. Patient extubated at Day 9, respiratory physiotherapy started. To surgical ward at Day 12. Pulmonary function tests below normal. Discharged at Day 20. Physiotherapy continued. Exempt from active duty.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

NA-autoinjector (atropine and oxime) as self aid. No other medication. Stripped naked and flushed with water before entering into medical facility.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
104	135	65	20/min	99	Alert	4	5	6	Eyes reddish and pupils dilated

List of injuries (or disease findings):

No injuries. Complains of visual impairment, dizziness and dry mouth.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+2:00hr	HR 90, NIBP 130/60, Resp 16, Sats 100, Temp 101 F. Pupils still dilated and mouth dry. Dizziness subsided. No signs of NA exposure. Iv-line and cooling.
+4:00hr	HR 80, NIBP 120/70, Resp 20, Sats 94, Temp 99.5. Increasing distress and dry cough. O2-mask, consider evacuation to Role 2.
+8:00hr	HR 110, NIBP 118/56, Resp 30, Sats 88 (O2-mask), Temp 99. Severe distress and continuous productive cough. Restless and anguished. Prepare to RSI. Sudden collapse and short CPR.
+10:00hr	Intubated and ventilated by field ventilator. HR 98, NIBP 86/40, Sats 90 (FiO2 100%, PEEP 5), CXR: bilateral opacities. Emergency evacuation to Role 3.
+14:00hr	Role 3/ICU: 'Maximal' ventilator settings; Sats 76-88, pO2 5.6, pCO2 6.4, pH 7.28, BE 2.0, HR 80-100, MAP 55-65 (norepinephrine infusion), Hb 148, Leuc 12.2, Trom 110, CRP 40, S-Krea 120 umol/l, S-Bil 24 umol/l
+1d	HR-CT: alveolar oedema and interstitial inflammation l.a., ECHO: EF 60%, mild MI. pO2 5.8, pCO2 6.6, pH 7.30, BE 1.5
+2d	pO2 6.0, pCO2 6.8, pH 7.26, BE 3.5, Hb 152, Leuc 16.2, Trom 88, CRP 78, S-Krea 144, S-Bil 29. Antibiotic started. Lung recruitment maneuvers needed. Consider prone positioning.
+4d	HR-CT: more pronounced oedema. In prone position: pO2 6.6, pCO2 6.7, pH 7.31, BE 3.3. Hb 138, Leuc 18.1, Trom 85, CRP 112, S-Krea 151, S-Bil 33.

EXPECTED OUTCOME OF CASE

Deterioration on Day 6. MOF. Evacuated to Role 4. Considered ECMO therapy, but because of MOF declined. Short renal replacement therapy during Days 7 to 12. Change for the better on Day 12. Transferred from intensive care to ward on Day 20. In the ward, treatment and rehabilitation continued for three weeks. After six months almost complete recovery.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Patient rescued from the vehicle. Medic tied the wounds on neck and shoulder and set NPA.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
80	100	50	28/min	90	Pain	1	3	5	

List of injuries (or disease findings):

Deep wound on the right side of neck, superficial wound on right shoulder, burns to the face (forehead and both cheeks), eyelids swollen, some secretions, coughing.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1:00hr	Increasing shortness of breath. Both wheezing and stridor. Coughing heavily. Sats 86 with O2-mask. Resp 30. Facial swelling increased. Neck wound oozing through dressings. HR 96, BP 90/46. Consider RSI and wound debridement (Role 2?).
+2:00hr	Patient intubated and respiratory support initiated in sedation. FiO2 100%, PEEP 5. Sats 92. Fluid management and TXA. Antibiotic. HR 88, NIBP 80/40. Consider vasopressor and FDP. Burn dressings on the face. Evacuate to Role 2/3 (preferred)
+4:00hr	Role 2: Debridement of neck wound. HR 110, NIBP 100/60 (2 FDPs and vasopressor), Sats 88, FiO2 100%, pO2 6.8, pCO2 6.2, pH 7.28, BE -2.0, Hb 98. CXR bilateral opacities. Suspicion on phosgene/PFIP exposure.
+8:00hr	Sats 80-85, copious secretions, FiO2 100%, PEEP 5, pO2 6.3, pCO2 5.8, pH 7.24, BE -1.5, HR 100, NIBP 96/56. Field respirator unsuitable for this patient. Consider evacuation to Role 3/ICU.
+12:00hr	Role 3/ICU: Lung protecting ventilation. Invasive haemodymic monitoring. Bronchoscopy: aqueous secretions, mild inflammation of mucous membranes, samples taken. PEEP 8-12, FIO2 80%, pO2 6.2, pCO2 6.4, pH 7.22, BE -1.0, MAP 55-65, HR 90-110 (norepinephrine infusion).
+1d	HR-CT: bilateral basal infiltrates and opacities, small pneumothx on right apex. pO2 5.8, pCO2 6.5, pH 7.20, BE 2.0, Hb 88, Trom 130, CRP 130. ICD on right side. Broad spectrum antibiotic. Ophthalmologist and plastic surgeon are consulted.
+2d	pO2 5.6, pCO2 6.6, pH 7.24, BE 3.0, CRP 145. MAP 60-70, CVP 14-18, PCWP 10-14. ECHO: moderate tricuspic regurgitation, EF 45%. Revision of the neck wound in the operating room. Consider prone positioning and systemic corticosteroid treatment back in the ICU.
+4d	HR-CT: opacities densified, pneumothx diminished. pO2 6.0, pCO2 6.4, pH 7.30, BE 4.0, CRP 112, Hb 82, Trom 110. Prone positioning in12 h intervals. Consider surgical airway.

EXPECTED OUTCOME OF CASE

Without early ICU treatment and sophisticated pulmonary care outcome is very poor.
After one week transfer to Role 4 for further treatment. Septic episode on days 9 to 12. Resolution with antifungal treatment and replacing all the catheters. Decanylation on day 18. In the pulmonary ward days 20 to 38. Lung function tests below normal six months after the event.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

ADDITIONAL COMMENTS including Moulage Information

Fresh burn marks on forehead and both cheeks. Carbon residues around the mouth and oral mucosa. Deep bleeding wound on the right side of neck. Smaller wound on right shoulder. Swollen eyelids. NPA in place.

E	White-yellow smoke from local tank truck, smelled like swimming pool.
C	Depressed
R	40-50, shallow breathing.
E	Normal
S	White foam, with reddish tint.
S	Cyanotic

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Not wearing a gas mask.
Bag Valve Mask ventilation.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
115	100	70	45/min	85	Pain	2	4	2	

List of injuries (or disease findings):

Responsive to pain.
Cyanotic skin.
Chest auscultation: significant bilateral rales and crackles.
CRT 2

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+45min	Arrives medical facility.
+47min	Need for suction, administration of oxygen 15 liters/min to keep sat O2 > 88%. Need for bronchodilators.
+52min	Airway still critical, shallow breathing more pronounced. Arterial blood gas PaO2 8,2 kPa (15 L oxygen/min) and PaCO2 9,2 kPa. Intubation necessary.

EXPECTED OUTCOME OF CASE

Partial recovery within weeks but with reduced lung function..

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Arterial blood gas: pO2 below normal. Lactate and pCO2 elevated. pH 7.25.	Chest x-ray: bilateral opacities.	

ADDITIONAL COMMENTS including Moulage Information
Face: pale, cyanotic lips.

		S	Normal

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Respirator applied.
Wounds dressed (no catastrophic hemorrhage)

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
120	90	40	36/min	85%	Verbal	3	4	6	Respiratory Distress

List of injuries (or disease findings):

Chest:
Right sided frag wounds and reduced air entry with hyper-resonant percussion. No neck signs or surgical emphysema. Left sided chest has scattered crackles.
Chest X-Ray - right sided pneumothorax, not under tension. Respiratory dynamics improve with chest drain.
Needs repatriation to home nation.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+90min	Arrives MTF
+100min	Assessment - respiratory distress. Pneumothorax diagnosed clinically or radiologically
+120min	Chest drain improves respiratory dynamics - sats improve, work of breathing and RR reduced (but not to "normal") bilateral crackles remain. Cough and chest pain remain.
+24hr	Remains on oxygen to maintain sats >94%
+48hr	Increased oxygen requirement
+72hr	Repatriation back to home nation, chest drain still in situ.

EXPECTED OUTCOME OF CASE

Survives, needs to be repatriated for ongoing chest care. No critical incidents in timeline.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
ABG initially pH 7.47 PaO2 10 kPa PaCO2 3.4 Lactate 3.0	Chest X-Ray - right sided pneumothorax CT (if done) right sided pneumothorax (or chest drain depending upon timing) no other injuries from frag wound - all superficial.	

ADDITIONAL COMMENTS including Moulage Information
Chest frag injury causing pneumothroax and resp distress - improves with chest drain Chlorine exposure causes chest deterioration on day 2 Required repatriation to home nation.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

OP airway inserted and tolerated, airway suction

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
130	100	65	40/min	90	Unresp	1	1	1	Sluggish pupils

List of injuries (or disease findings):

No lateralising neurological signs but GCS 3 with unprotected airway - will require intubation
Chest - bilateral crackles and low sats despite oxygen

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+40min	Arrive MTF
+45min	Should be intubated for unconsciousness
+60min	CT scan - multiple frag wounds to skull causing fractures and contusional brain injury - no neurosurgical intervention required. No other injuries
+6hr	More difficult to oxygenate, repatriation planned
+24hr	Stable on high FiO2, if ICP bolt - ICPs in low 20s, pupils remain reactive
+48hr	Repatriation

EXPECTED OUTCOME OF CASE

Contusional brain injury and severe lung injury - require repatriation to home nation via CCAST
ICPs high but not high enough for intervention - can have osmotic therapy
Reachback for neurosurgical input

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
ABG - shows hypoxaemia	CT - multiple frag wounds to skull causing fractures and contusional brain injury - no neurosurgical intervention required. No other injuries	

ADDITIONAL COMMENTS including Moulage Information

Chest injury from chlorine
Contusional brain injury requring max medical management on ITU and repatriation to home nation.

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
120	90	40	40/min	85	Pain	2	2	5	Large amounts of frothy sputum

M

I Exposure to vapour

S Breathing difficulty

T <c> **M** No Cat Heam. No mask

A **A** Secretions, reduced conscious level. Will develop airway issue

B **R** High RR, high respiratory effort, +++ secretions

C **C** Tachycardia and hypotensive, CRT 4 seconds

D **H** Responds to pain. Unable to speak or give history. PERL

E **E** None

A	NKDA (from uniform tag)
M	Unknown
P	Unknown
L	Unknown
E	Smell of swimming pool
C	Depressed conscious level
R	High RR, high resp effort, +++ secretions
E	Normal pupils, red irritated conjunctiva
S	Blood stained foam secretions
S	Cyanotic, dry

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Was not wearing respirator initially - was put on following exposure
No treatment given

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
130	80	40	50/min	78	Pain	1	2	5	Frothy secretions

List of injuries (or disease findings):

Chest examination:
Widespread crackles
Blood stained sputum
Cyanosis
Dehyrdated with CRT 4 seconds

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+60min	Arrives MTF
+65min	Initial assessment, airway suction and high flow oxygen (15L via NRB mask) sats improve to 85% work of breathing does not improve
+70min	ABG performed pH 7.5, PaO2 7.8kPa, PaCO2 2.7 kPa CPAP applied if MTF has this capacity- this improves oxygenation but patient does not tolerate it. If no CPAP available proceed to intubation.
+80min	CPAP not tolerated and/or further drop in Sats - should be intubated and mechanically ventilated - High PEEP, lung protective ventilation
+90min	Haemodynamic instability following intubation - becomes hypotensive (due to dehydration) - improves with fluid rescusitation
+3hr	On ITU - FiO2 0.7 sats fall to 80%, improve to 88 with FiO2 1.0. No pnemothoraces. Prone ventilation does not improve oxygenation. PF ratio 13
+5hr	Cardiac arrest on max ventilatory support - ALS if attempted is unsucessful

EXPECTED OUTCOME OF CASE

Death from failure to oxygenate despite all interventions

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
ABG: pH 7.5, PaO2 7.8kPa, PaCO2 2.7 kPa WCC 14 CRP 78 Coag normal Hb normal	Chest x-ray - florid bilateral infiltrates POC echo - empty initially but good LV function	

ADDITIONAL COMMENTS including Moulage Information

Will need intensive care - so admission or transfer depending upon MTF.

Becomes increasingly difficult to oxygenate despite high PEEP and high FiO2
Does not respond to prone ventilation

Hypoxic cardiac arrest on ITU.

C	Unconscious
R	Rapid RR, high work of breathing, pink frothy sputum
E	Normal pupils, pink conjnctiva
S	Pink frothy sputum
S	Dry, shut down, cyanosis

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Celox gauze to left groin junctional hemorrhage
Respirator applied post exposure

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
140	70	30	40/min	85	Unresp	1	2	4	

List of injuries (or disease findings):

Cat hemorrhage controlled by celox
Concern regarding abdominal frag wounds - rigid and tender abdomen
Chest - widespread crackles

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+ 30min	Arrive MTF
+35min	Trauma primary survey - identifies treated catastrophic hemorrhage, haemodynamic instability, FAST (if possible) shows abdominal free fluid. Blood product transfusion should commence. Low sats and frothy sputum - sats 88% on 15L oxygen via NRB mask
+45min	CT scan (if possible) shows widespread pulmonary infiltrates, blood in abdomen and a transected femoral artery
+60min	Theatre for laparotomy - bleeding from mesenteric vessels, some bowel isachaemia, faecal contamination. Vascular shunt successful. Difficult to ventilate and requires high FiO2
+120min	Back on ITU. Remains tachycardic despite blood products. Difficult to ventilate PaO2 7.5 kPa on FiO2 0.9 and PEEP 15
+24hr	For repatriation to home nation. Still very unstable from a respiratory point of view. Sepsis from intra-abdominal pathology - requires second laparotomy which finds large areas of bowel ischaemia
+48hr	Repatriated and subsequently dies in transfer (from MOF) or dies in ITU of MOF if deemed unstable for transfer.

EXPECTED OUTCOME OF CASE

Death from MOF - sepsis from abdominal fragmentation injury as well as inability to oxygenate from chlorine mediated lung damage/ARDS

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Initial ABG pH 7.10 PaO2 8.9 kPa PaCO2 5.3 kPa Lactate 10 Subsequent ABG worse in all regards	CXR - widespread pulmonary infiltrates CT scan (if possible) shows widespread pulmonary infiltrates, blood in abdomen and a transected femoral artery	

ADDITIONAL COMMENTS including Moulage Information

Death on ITU or CCAST transfer back to home nation.

MOF from injury and chlorine exposure.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Was given opiate (morphine / fentanyl) and supplemental oxygen

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
90	130	75	20/min	98	Verbal	3	4	6	

List of injuries (or disease findings):

Small bruises all over his body
Open fracture on right humerus
Small open wounds caused by debris from the explosion on face

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+45min	Arrives to medical facility, vitals see above
+50min	Possible cyanide intoxication noted, still stable
+55min	Decontamination, soapy wash
+60min	Sodium nitrite given (somewhat unnecessarily). Patient develops tachycardia, tachypnea, his saturation drops, 120/min, 30/min, 94%.
+75min	Oxygen given, saturation 97%
+120min	Methylene blue given, tachycardia eases 90/min, normal breath 18/min, still normal saturation.

EXPECTED OUTCOME OF CASE

Sodium nitrite might cause severe methemoglobinaemia, which lowers the oxygen delivery to the tissues. This might worsen the clinical symptoms. Methemoglobinaemia can be reversed by methylene blue injection.

Patient admitted for observation, will need trauma surgery

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)

		E	
		C	Drowsy, weak, can not walk, stand up.
		R	Tachypneic, cough / not yet
		E	Normal
		S	Normal
		S	Pale, hot

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Did not get any treatment yet, still in the hot zone

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
90	85	55	32/min	98	Verbal	3	4	6	

List of injuries (or disease findings):

No external injuries, wounds.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+5min	Oxygen put on by first responders
+15min	Arrives to medical facility
+20min	Lactate acidosis with normal paO2, saturation, elevated anion gap, possible cyanide toxicity - amilnitrite inhaled, no improvement
+25min	4 DMAP, sulfur donors (depending on national protocols, availability) given.
+120min	Patient notably improves after treatment
+180min	Oxygen still given, saturation back to normal 99%

EXPECTED OUTCOME OF CASE

Patient survives the initial cyanide poisoning, after supportive and specific treatment, the patient recovers, might return to duty on day 2.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
When performed lee-jones is positive Whole blood cyanide: 62 umol/l	Not relevant	

ADDITIONAL COMMENTS including Moulage Information
Moulage: drowsy patient in respiratory distress

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Oxygen, painkillers, normal saline given on site

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
90	95	55	28/min	98	Verbal	2	3	5	

List of injuries (or disease findings):

Besides tibial fracture, open wounds and bruises on his body, also hit his head during the impact

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+5	Oxygen put on by first responders, painkillers give, iv fluid started
+12	Arrives to medical facility
+15	Lactate acidosis with normal paO2, saturation, elevated anion gap, possible cyanide toxicity - amilnitrite inhaled
+25	Because of known G-6-P deficiency, sodium nitrite contraindicated. 4DMAP given.
+120	Patient stabilises after treatment
+180	Transferred to ROLE2/3

EXPECTED OUTCOME OF CASE

Patient had fragmentation injuries due to the explosion, also cyanide poisoning. Cyanide was moderate, could be reversed by supportive and specific treatment. Still needs ROLE3 care for OP/REHAB of tibial fracture

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
When performed lee-jones is positive whole blood cyanide: 52 umol/l	Tibial fracture Head CT normal No PTX on chest x-ray/CT	

ADDITIONAL COMMENTS including Moulage Information

Moulage: drowsy patient in respiratory distress with tibial fracture, visible head injury (meaning large wound). Many bruises.

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Supplemental oxygen.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
90	151	89	18/min	100	Alert	4	5	6	

List of injuries (or disease findings):

Headache.
Shaking of arms, appears distressed.
CRT 2

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+4min	Arrives at medical facility.
+7min	After initial assessment, toxidrome and events leading up to trauma, the conclusions should be that the victim likely does not have cyanide or H2S poisoning. She should be kept for observation and evaluated if supplemental oxygen is needed.

EXPECTED OUTCOME OF CASE

Discharge and RTD (if military)

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

ADDITIONAL COMMENTS including Moulage Information

Headache.
Shaking of arms, appears distressed.
Scenario can be set up with or without gas mask and personal protection equipment.

		S	Hot

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Was given opiate (morphine / fentanyl) and supplemental oxygen

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
90	130	75	20/min	98	Verbal	3	4	6	

List of injuries (or disease findings):

Small bruises all over his body
Open fracture on right humerus
Small open wounds caused by debris from the explosion on face

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+45min	Arrives to medical facility, vitals see above
+50min	Possible cyanide/H2S intoxication noted, still stable
+55min	Decontamination, soapy wash
+60min	If sodium nitrite given (somewhat unnecessarily), patient develops tachycardia, tachypnea, his saturation drops, 120/min, 30/min, 94%.
+75min	Oxygen given, saturation 97%

EXPECTED OUTCOME OF CASE

Sodium nitrite might cause severe methemoglobinaemia, which lowers the oxygen delivery to the tissues. This might worsen the clinical symptoms. Methemoglobinaemia can be reversed by methylene blue injection.

Patient admitted for observation, will need trauma surgery

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
	Dislocated fracture of right humerus

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Extracted from hazard, and left in well ventilated area.
Oxygen administered once Medics arrive.
No anticonvulsants given as seizures stopped spontaneously.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
110	105	85	24/min	91	Pain	1	2	3	Signs of cerebral irriation

List of injuries (or disease findings):

Hydrogen sulfide exposure with CNS features and respiratory distress
Minor head injury due to collapse - bruising to front of face / nose (CT if done - normal)

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1hr	Patient remains cerebrally irritated
+2hr	Patient dependent on oxygen with potential pulmonary oedema
	On recognition of worsening oxygenation - consideration to ventilated patient (patient's level of consciousness prevents CPAP)
+1d	Oxygenation improves with ventilation with PEEP. Trial of extubation is successful but with some continuing confusion / amnesia (GCS 14) and further monitoring
+3d	Slow improvement

EXPECTED OUTCOME OF CASE

Patient slowly improves with neuro rehab and chest physio to improve respiratory function.

Decontamination is not specifically required is exposure to gas only - however removal of clothing as a T1 patient is recommended.

	E **E**	**S**	Normal
		S	Cyanosed

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Extracted from hazard, and left in well ventilated area.
Bag valve mask ventilation with airway adjunct and oxygen
Return on spontaneous respiration after 10 minutes
(Pre-hospital intubation and ventilation depending on pre-hospital response team)

Decontamination not required if gas exposure - although removal of clothing recommended.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
124	92	52	18/min	94	Unresp	1	1	1	

List of injuries (or disease findings):

Hydrogen sulfide exposure
Secondary hypoxic brain injury

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+10min	Seizure with possible respiratory arrest
+30min	Breathing support with return of respiration after 10 minutes
+1hr	Patient spontaneously breathing but unconscious (GCS 3)
	Either pre-hospital or hospital intubation and ventilation due to unconscious

EXPECTED OUTCOME OF CASE

Patient has severe hypoxic brain injury with a failure to respond to treatment. Serial CT shows loss of grey-white matter differentiation. Failure to extubate patient - decorticate posturing with myoclonus.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Arterial Blood Gas pH 7.22 pCO2 8.7 pO2 18.2 (on 10L O2) pO2 10.2 (air) BXS - 8.1 Bicarb 20 Lactate 9.8 Normal biochemistry Troponin 356 (raised) Hb 128 WCC 7.1 Plat 248 ECG - Sinus rhythm with generalised ST depression.	Chest XR normal CT head (on arrival) - normal, no bleed. CT head (> 24 hours) - loss of grey-white matter differentiation - consistent with severe hypoxic brain injury.	
ADDITIONAL COMMENTS including Moulage Information		
Patient initially cyanosed.

List of injuries (or disease findings):

Immediate nausea and upset stomach; watering mouth and frequent swallowing to avoid vomiting.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+20min	Immediate nausea and vomiting
+3h	Massive lymphocyte drop, continued nausea and vomiting
+1d	Granulocytosis, continued nausea and vomiting
+4d	Granulo- and thrombopenia, painful cramps, diarrhea, dizziness, aching joints, fever, lack of appetite, sores in mouth/throat, chills
+30d	Convalescence

EXPECTED OUTCOME OF CASE

Individual will survive with prompt medical support, but will have a long convalescence and will require substantial care.

130	100	70	12/min	94%	Verbal	3	3	5	

List of injuries (or disease findings):

Whole body: Immediate nausea and vomiting, including dry heaves
Cutaneous: Immediate pain, tingling, swelling

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+20min	Immediate nausea and vomiting, immediate pain, tingling and swelling at cutaneous injury site
+3h	Massive lymphocyte drop, continued nausea, vomiting, pain, tingling, and swelling
+1d	Blisters, early ischemia, substantial pain, granulocytosis
+4d	Granulo- and thrombopenia, painful cramps, diarrhea, dizziness, aching joints, fever, lack of appetite, sores in mouth/throat, chills
+14d	Tissue necrosis
+1-35d	Death on day 1 through day 35 based on dose

EXPECTED OUTCOME OF CASE

Individual will die, but depending on the support and the individual´s radiosensitivity there is a chance to survive at doses of 7-8 Gy. Local radiation exposure will result in a necrosis and new treatment regimens such as mesenchymal stem cells will be required.

Analytical Results

Method	Result	Reference range
Genomic tests		
B. anthracis (realtime PCR, dhp61)	**positive**	negative
B. anthracis (realtime PCR, capC, pagA)	**positive**	negative
Other tests		
Bacillus anthracis PA (antigen)	**positive**	negative
Bacterial culture	**positive**	negative
Gram staining (microscopy)	**positive**	negative

Assessment and evaluation

Detection of ***Bacillus anthracis*** **Protective Antigen** in the antigen-enzyme-linked immunosorbent assay (**Ag-ELISA**) in the submitted sample.

Detection of **gram-positive rods** in the gram staining. No detection of spores in the gram staining.

Genomic detection of Bacillus anthracis-specific nucleid acid (target: dhp61) and Bacillus anthracis-**specific virulence factor** (target: pagA) in the submitted sample.

Based on the microbiological findings, there is an **urgent suspicion of anthrax.**

Additional Information

Bacillus anthracis

B. anthracis, the causative agent of anthrax, is a gram-positive sporulating rod with spores being the usual infective form. Incubation period is usually between 1-6 days (although longer periods of up to 60 days have been noted). Anthrax presents as three distinct syndromes depending on route of infection, i.e. cutaneous, gastrointestinal or inhalational, which is the most severe form. Initial symptoms of inhalational anthrax include fever, malaise, fatigue and mild chest discomfort with dry cough which progress rapidly to severe respiratory distress with dyspnea, cyanosis and shock. Death typically occurs within 24 to 36 h after onset of severe symptoms. Many of the effects of anthrax are mediated through a toxin, which consists of three components: the protective antigen (PA), the lethal factor (LF) and the oedema factor (EF). *B. anthracis* is detectable by gram stain, serum levels of PA and anthrax-specific qPCR.

Analytical Results

Method	Result	Reference range
Genomic tests		
B. anthracis (realtime PCR, dhp61)	**positive**	negative
B. anthracis (realtime PCR, capC, pagA)	**positive**	negative
Other tests		
Bacillus anthracis PA (antigen)	**positive**	negative
Bacterial culture	**positive**	negative
Gram staining (microscopy)	**positive**	negative

Assessment and evaluation

Detection of ***Bacillus anthracis*** **Protective Antigen** in the antigen-enzyme-linked immunosorbent assay (**Ag-ELISA**) in the submitted sample.

Detection of **gram-positive rods** in the gram staining. No detection of spores in the gram staining.

Genomic detection of Bacillus anthracis-specific nucleid acid (target: dhp61) and Bacillus anthracis-**specific virulence factor** (target: pagA) in the submitted sample.

Based on the microbiological findings, there is an **urgent suspicion of anthrax.**

Additional Information

Bacillus anthracis

B. anthracis, the causative agent of anthrax, is a gram-positive sporulating rod with spores being the usual infective form. Incubation period is usually between 1-6 days (although longer periods of up to 60 days have been noted). Anthrax presents as three distinct syndromes depending on route of infection, i.e. cutaneous, gastrointestinal or inhalational, which is the most severe form. Initial symptoms of inhalational anthrax include fever, malaise, fatigue and mild chest discomfort with dry cough which progress rapidly to severe respiratory distress with dyspnea, cyanosis and shock. Death typically occurs within 24 to 36 h after onset of severe symptoms. Many of the effects of anthrax are mediated through a toxin, which consists of three components: the protective antigen (PA), the lethal factor (LF) and the oedema factor (EF). *B. anthracis* is detectable by gram stain, serum levels of PA and anthrax-specific qPCR.

Botulinum toxin (antigen)	**positive**	negative

Assessment and evaluation

Detection of Botulinum Toxin in the antigen-enzyme-linked immunosorbent assay (**Ag-ELISA**) in the submitted sample. No detection of vegetative bacteria or spores in the gram staining.

Genomic detection of Botulinum toxin specific **nucleic acid** in the submitted sample.

Based on the microbiological findings, there is an urgent suspicion of botulism.

Additional Information

Botulinum Neurotoxins (BoNTs)

The botulinum neurotoxins are a group of seven related proteins produced by spore-forming bacillus *Clostridium botulinum* as well as three other *Clostridium* species (*C. butyricum, C. baratii, C. argentinense*). The BoNTs are the most potent neurotoxins known. *Clostridium* spores are ubiquitous; they germinate into vegetative bacteria that can produce toxins under anaerobic conditions. In a bioterroristic attack, BoNTs could be successfully delivered via aerosol or used to contaminate food- and water supplies. Regardless of the route of exposure, the clinical syndrome produced by these toxins is botulism. Symptoms usually begin with cranial nerve palsies (i.e. drooping eyelids, blurred vision, double vision, dry mouth/throat, difficulty swallowing and voice impairment). This is followed by progressive descending flaccid paralysis, generalized weakness and progression to respiratory failure and death. Onset of symptoms is dose dependent and may begin as early as 12 h after exposure but can also take several days to develop.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+2hr	Transfusion of concentrated red cells
+1d	MRI of the right shoulder, needle aspiration of the bursa after administration of platelet concentrate
+4d	Growth of B. melitensis in the bursal aspiration fluid, antibiotic treatment with Ciprofloxacin and Rifampicin
+10d	Raise of liver parameters, raise of platelet count, no fever, increased condition and breathing
+12d	Discharged

EXPECTED OUTCOME OF CASE

Follow up after 8 weeks: Decrease in right shoulder swelling, inconspicuous lab results, no relapse.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
On admission: Hb 9.0 g/dl WBC 3.7x10^9/l Platelets 20x10^9/l CRP 80mg/l ESR 61mm/h Liver enzymes GGT 200 UI/l AST 70 UI/ml ALT 65 UI/ml See lab report attached	Ultrasound: Hepatosplenomegaly MRI right shoulder: joint effusion, increased bursal fluid in subacromial and subdeltoid bursa with surrounding tissue edema Chest radiography on admission: Consolidation in the right inferior lobe compatible with lobar pneumonia CT scan of the chest on admission: Glass round opacity in the right inferior lobe CT scan of the chest at the end of the treatment: Significant improvement compared to the first CT scan See images on page 5	Ultrasound MRI Inspection shoulder Chest radiography, CT scans See images on page 5

ADDITIONAL COMMENTS including Moulage Information

The patient seems to be depressed, he´s sweating, he needs to change his nightgown at least once per night.

He has difficulties breathing, his right shoulder aches and he can't lift his shoulder higher than 90°.

The shoulder is swollen and hurts when moving and when being touched.

Analytical Results

Method	Result	Reference range
Genomic tests		
Botulinum toxin (PCR)	**positive**	negative
Other tests		
Gram staining (microscopy)	negative	negative
Botulinum toxin (antigen)	**positive**	negative

Assessment and evaluation

Detection of Botulinum Toxin in the antigen-enzyme-linked immunosorbent assay (**Ag-ELISA**) in the submitted sample. No detection of vegetative bacteria or spores in the gram staining.

Genomic detection of Botulinum toxin specific **nucleic acid** in the submitted sample.

Based on the microbiological findings, there is an urgent suspicion of botulism.

Additional Information

Botulinum Neurotoxins (BoNTs)

The botulinum neurotoxins are a group of seven related proteins produced by spore-forming bacillus *Clostridium botulinum* as well as three other *Clostridium* species (*C. butyricum, C. baratii, C. argentinense*). The BoNTs are the most potent neurotoxins known. *Clostridium* spores are ubiquitous; they germinate into vegetative bacteria that can produce toxins under anaerobic conditions. In a bioterroristic attack, BoNTs could be successfully delivered via aerosol or used to contaminate food- and water supplies. Regardless of the route of exposure, the clinical syndrome produced by these toxins is botulism. Symptoms usually begin with cranial nerve palsies (i.e. drooping eyelids, blurred vision, double vision, dry mouth/throat, difficulty swallowing and voice impairment). This is followed by progressive descending flaccid paralysis, generalized weakness and progression to respiratory failure and death. Onset of symptoms is dose dependent and may begin as early as 12 h after exposure but can also take several days to develop.

List of injuries (or disease findings):

Fever
Pupils symmetrical, react promptly to light
No neurological deficit
Exsiccosis

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+1d	Sepsis signs: treatment with antibiotics
+5d	Drop in haemoglobin due to massive bleeding (bloody diarrhoea): blood transfusion 3 red cell concentrates and increased IV intake 5l
+6d	Start of palliative care
+7d	HR 130/min, NIBP 80/40mmHg, RESP 30/min, SATS 80%, AVPU/GCS U/111
+7d	Deceased

EXPECTED OUTCOME OF CASE

The patient's condition deteriorates despite active treatment. His vital values deteriorate as do his symptoms. The diarrhoea changes to increasingly bloody. The bloody blisters open up to form persisting skin lesions. At some point the decision for a change in treatment (palliative care) has to be made. In the end the patient dies from the complications of an Ebola virus infection.

125	90	60	20/min	96%	Pain	2	1	5	Comatose

List of injuries (or disease findings):

- Feeling unwell for 2 to 3 days. Complained to colleagues of muscle aches and a stiff neck.
- Found unresponsive by colleagues.
- Febrile

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-48:00H	Complained to colleagues of not feeling well, headache, muscle aches, stiff neck and feeling feverish. Did not seek medical attention.
0:00H	Arrives comatose. Febrile, hypotensive, erratic breathing with nuchal rigidity. Patient intubated and ventilated. Two IVs start, one TKVO (for meds) and second for fluid resuscitation (e.g. NS 500mL bolus for 3 and then 30mL/kg over).
+0:10H	Start second IV. Screening and tests ordered: CBC differential, blood for cultures, and serum for toxin assays and pathogen identification. Electrolytes, INR, PT aPTT, liver function tests, BUN, creatinine, urine sample. Chest X-ray AP and lateral, CT of head (if available, to rule out space occupying lesion). Monitor vitals, O2 sats, EKG. CSF opening pressure, CSF for analysis including PCR to rule out other pathogens (e.g. CSF PCR HSV-1, HSV-2, and enteroviruses). Patient started empirically on antiviral (e.g. acyclovir) and broad spectrum antibiotics (e.g. imipenem).
+1:00H	Patient is stable, with a slight improvement in blood pressure but still hypotensive; urine output has increased. Focused neurologic exam reveals a facial (7th) nerve palsy.
+3:00H	Hemodynamically stable. Patient has a self-limiting seizure. Started on anti-seizure medications.
+48:00H	Continues to be hemodynamically stable. Comatose. No seizures. Patient to be strategically 'medevaced'.
+7D	Patient status improved and patient was extubated. Diagnosis confirmed as EEEV.
long term	Continued to have neurological sequelae (e.g. right facial nerve palsy, cognitive impairment).

EXPECTED OUTCOME OF CASE

Partial recovery with right facial nerve palsy, cognitive impairment

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- CBC:
  - WBC: 17.2k with 72% PMNs

  - Opening pressure: 32 cm H2O
  - WBC: 170 (36% lymphocytes, 64% neutrophils)
  - Protein: 123 mg/dL
  - Glucose: 62 mg/dL
- Serology: within 2 weeks the hemagglutination inhibition assay (HAI) for EEEV confirmed diagnosis
	- CXR: normal
	- CT scan of head: normal	

ADDITIONAL COMMENTS including Moulage Information

Patient is considered "non-contaminated" given that exposure would have occurred 5-15 days prior to the onset of symptoms.

The main core competency is to identify a biological syndrome and management of sepsis. This includes steps to rule out and treat empirically possible infectious agents and identifying sepsis early. Early presentation of sepsis include: blood pressure (BP) < 100 or lack of radial pulse (suggestive of septic shock); respiratory rate > 22 breaths per minute; altered mental status; and non-blanching rash, decreased capillary refill or skin mottling.

Moulage: feverish

HISTORY OF PRESENTING COMPLAINT / INJURIES:

Epidemiological remarks:

(some explanation of how the person was exposed 3-5 days ago; explanation must be suitable for primary pneumonic plague; e.g., bio attack, exposure to another person with pneumonic plague, or some exceptional natural circumstances)

INITIAL SYMPTOMS AND/OR SIGNS

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
112	122	78	20	96	A	4	5	6	T = 37.9°C

M		**A**	none
I	none	**M**	one Acetaminophen tablet today
S	fever, chills, chest pain, headache, unproductive cough, vomiting	**P**	unremarkable
T	<c> **M** Acetaminophen 500mg p.o.	**L**	yesterday, vomiting twice today
	A **A** without pathological findings	**E**	
	B **R** fast, rough, wet railes in both lungs	**C**	exhausted, not confused
	C **C** IV fluids, tachycardia, hypotension	**R**	respiration elevated, hurts
	D **H** blood sugar 88 mg/dl	**E**	within normal limits
	E **E** shock index pos.	**S**	dry cough
		S	hot, sweaty

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

IV started, Acetaminophen 1g IV to reduce the fever
1l Ringer IV fast, 1.5l Ringer / 24h, monitoring vital signs
Influenza rapid test negative
O2 supply (mask 6l)
Quarantine should be instituted once clinicians suspect a diagnosis of Plague

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
132	93	66	30	95 (6l)	V	3	5	6	T = 37.3°C

List of injuries (or disease findings):

Inspection: pale face, sweaty, chills
Auscultation: wet rales in both lungs, Abdomen with hypoactive bowel sounds
Palpation/Percussion: lungs: dull resonance on percussion, Abdomen: flat and soft without tenderness

CT scan of the chest: Pneumonia, consolidations
EKG: sinus rhythm, HR 132/min

suspected diagnosis: viral pneumonia -> ICU, Intubation readiness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

on adm.	blood samples and blood cultures should be obtained, as should a gram stain of sputum
+2:00H	Gram staining: gram negative rods -> IV Tazobac (Pip/Taz 4g/0.5g q6h) or some comparable broad spectrum antibiotic should be administered
+1D	sudden onset of cough with bloody sputum, acute dyspnoea
+1D	Chest X-Ray: Consolidations and patchy shadows
+1D	HR 140/min, NIPB 79/44mmHg, RESP 38/min, SATS 80% (10l O2), T 39.8°C -> endotracheal intubation and mechanical ventilation + Gentamicin 5mg/kg IV once daily
+1.5D	vital signs deteriorate, DIC, beginning of multi organ failure
+2D	respiratory failure, growth of Yersinia pestis
+2.5D	death due to respiratory failure due to inhalational plague

EXPECTED OUTCOME OF CASE

Patient dies within 3 days after hospitalization (can be accelerated as needed for specific exercise purposes)

Or recovery if appropriate antibiotic therapy is initiated within ~1 day of symptom onset

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
On admission: WBC 14.2x10^9 /l Neutophils 11.7x10^9 /l Haemoglobin 136 g /l Platelets 156x10^9 /l CRP 82 mg/l Na 133 mmol/L K 3.4 mmol/l Glucose 106 mg/dl +1.5D (for non-survivor): WBC 44x10^9 /l Neutophils 37.0x10^9 /l Haemoglobin 113 g /l Platelets 92x10^9 /l CRP 150 mg/l Na 120 mmol/L K 2.8 mmol/l Glucose 114 mg/dl See attached lab report	EKG: tachycardic, sinus rhythm, HR 130/min Chest X-Ray: bilateral shadows Chest CT scan: pneumonia, consolidations, air bronchogram (first image on page 5 is on admission, second image is after 1 day)	EKG, CT scan of the chest, chest X-Ray (see images page 5)

ADDITIONAL COMMENTS including Moulage Information
Exhausted, sweaty, heavy breaths, dry cough, headache -> next day: worsening cough, now with bloody sputum -> Anxious patient because of all the blood and the feeling of suffocation

Analytical Results

Method	Result	Reference range
Genomic tests		
Y. pestis (realtime-PCR)	**positive**	negative
Y. pestis (Target: pla)		
Y. pestis (Target: caf)	**positive**	negative
Other tests		
Bacterial culture	**positive**	negative
Gram staining (microscopy)	**positive**	negative

Assessment and evaluation

Detection of **gram-negative rods** in the gram staining.

Growth of *Yerinia spp.* in the submitted bacterial culture material. Realtime-PCR was used for genus identification.

Genomic detection of *Yersinia pestis*-specific nucleic acid in the submitted sample.

Based on the microbiological findings, there is an **urgent suspicion of plague.**

Additional Information

Yersinia pestis

Y. pestis is a rod-shaped, non-motile, non-sporulating and gram-negative bacterium and the causative agent of plague, a zoonotic disease of rodents (rats, mice, ground squirrels etc.). Human plague can present in three different predominant forms: bubonic, septicemic and pneumonic. Pneumonic plague is caused by either inhalation (primary) of bacteria or spread to lungs during bacteremia (secondary). Primary pneumonic plague is the most severe form and characterized by a sudden onset of symptoms after an incubation period of 1-6 days. These include high fever, chills, malaise and cough progressing rapidly to severe dyspnea, cyanosis and eventually death from respiratory failure and circulatory collapse. Immediate start of antibiotic therapy is essential. Diagnosis can be made by plague-specific qPCR, detection of the F1-antigen and immunofluorescence.

Epidemiological remarks:

(note to MEL/MIL scripter: suggest adding some hint to help training audience know whether the exposure was natural or intentional. The course of disease would not differ. As designed, the history for this patient is: no known exposures to toxins, burn pits, fires. No previous history of respiratory diseases)

INITIAL SYMPTOMS AND/OR SIGNS

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
84	117	71	19/min	97%	Alert	4	5	6	Fatigued, somewhat anxious

M			
I	No obvious injuries		
S	Fever, chills, headache, myalgias		
T	**<c>** **M** None		
	A **A** Patent/Clear		
	B **R** Oxygen may be administered, although it is not necessary in this case.		
	C **C** IV fluids may be administered, although they are unnecessary in this case.		
	D **H** Retro-orbital headache		
	E **E** N/A		

A	None; an allergy to doxycycline could be used to make the scenario more complex.
M	None; use of malaria prophylaxis could be used to make scenario more complex.
P	Previously healthy servicemember.
L	Light breakfast- no appetite since then.
E	Participated in routine patrols until yesterday.
C	Slightly anxious
R	Normal
E	Normal
S	Normal
S	Normal

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

None is necessary in most cases of Q-Fever. Oxygen via face mask or nasal cannula might be given in some cases, as might IV fluids. Tylenol or Ibuprofen might be given for fever and headache.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
86	121	78	20/min	96%	Alert	4	5	6	Anxious, Tired

List of injuries (or disease findings):

Mild tachycardia likely related to anxiety, pain (headache) and fever.

Temperature 102.2F (38C).

Significant retro-orbital headache.

Generalized joint and muscle pain.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+0d	Ideally, treatment with Doxycycline instituted.
+3d	Fever reaches a peak of 104.0F (40C).
+5d	Assuming doxycycline was given early, fever abates. Mild fatigue persists for several more days, but servicemember can be returned to light duty.

EXPECTED OUTCOME OF CASE

See +5d above.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
If obtained-- WBC = 13.7 k/ml with normal differential ALT = 77 AST = 66 ALP = 135	None required. If obtained, a CXR may reveal mild diffuse infiltrates bilaterally.	

ADDITIONAL COMMENTS including Moulage Information

Patient is considered "non-contaminated" given that exposure to agent would have occurred weeks prior to the onset of symptoms.

No moulage necessary.

Q-Fever is enzootic among sheep, goats, and cattle in many areas of the world but, perhaps, most notably in the Middle East. Plausible scenarios might be set in that area and designed so as to require a determination as to whether disease is naturally-occurring or the result of a deliberate attack.

S	Normal

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

None is necessary in most cases of Q-Fever. Oxygen via face mask or nasal cannula might be given in some cases, as might IV fluids. Tylenol or Ibuprofen might be given for fever and headache.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
96	124	88	24/min	94%	Alert	4	5	6	Anxious

List of injuries (or disease findings):

Mild tachycardia, tachypnea, hypertension related to anxiety, pain (headache) and fever.

Temperature 102.2F (38.5C).

Significant retro-orbital headache.

Generalized joint and muscle pain.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

+2d	Patient develops cough and mild dyspnea. Respiratory rate increases to 30/minute, Oxygen saturation decreases to 91%, rales are heard on chest auscultation. A CXR is obtained and reveals pneumonia (see attached).
+11d	Fever continues for 11 days (range 5-14 days with treatment).
+29d	Residual cough and fatigue gradually improve over a four-week period.

EXPECTED OUTCOME OF CASE

If not already in place, oxygen should be given on D+2 when the patient's oxygen saturation decreased. Slow recovery is expected. Depending on the theater holding policy, the servicemember might be evacuated.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
Blood gas (if obtained) on D+2 shows: pH = 7.45 pO2 = 88 mmHg pCO2 = 32 mmHg HCO3 = 26 O2 sat = 91% If obtained-- WBC = 15.6 k/ml with normal differential ALT = 122 AST = 94 ALP = 233	CXR available-- demonstrates diffuse pneumonitis, most prominent in left lower lobe.  	

ADDITIONAL COMMENTS including Moulage Information

Patient is considered "non-contaminated" given that exposure to agent would have occurred weeks prior to the onset of symptoms, whether natural or intentional.

No moulage necessary.

Q-Fever is enzootic among sheep, goats, and cattle in many areas of the world but, perhaps, most notably in the Middle East. List of injuries (or disease findings):

- No injuries
- Cough (non-productive)
- Sweating
- Slight headache

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-9:00H	Woke up feeling unwell, with dry cough, sweating. Poor appetite but ate breakfast.
-3:00H	No appetite, skipped lunch, cough and fatigue getting worse. Gets short of breath when lifting equipment.
0:00H	Coughing, feverish, malaise at work. Directed by supervisor to see a physician.
+0:10H	Seen in triage, given N95 mask, and placed in a patient room by himself.
+0:20H	Seen and assessed by staff. All health care providers using proper PPE in case of infection.
+0:30H	Blood panel, throat specimen chest x-ray, acetaminophen orally every 4-6 hours as needed for ache and fever. Started on O2 by nasal prongs.
+1:00H	RT-PCR positive for SARS-CoV-2. Patient remains in isolation with close observation
+1:30H	Medical staff informs chain of command of the situation, contract tracing begins in earnest, with individuals with acute respiratory symptoms identified, isolated and tested.

EXPECTED OUTCOME OF CASE

Progressive recovery requiring minimal supportive care and monitoring. Isolation per current requirements.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
- RT-PCR obtained from a nasal swab: positive for SARS-CoV-2 (available in 1 hour) -EKG: normal sinus rhythm (if ordered) - CBC: - WBC: 8.6k (61% lymphocytes, 31% neutrophils) - Hb: 15.3 g/dL - Hct: 48.1% - Plts: 222k - Electrolytes: - Na: 139 mmol/L - K: 4.2 mmol/L - Cl: 102 mmol/L - HCO3: 25 mmol/L	- Chest X-ray (AP and lateral): normal	

ADDITIONAL COMMENTS including Moulage Information

Moulage: feverish

- The main core competency is high index of suspicion for COVID-19 and implementing key protective and control measures including appropriate PPE use, contacting tracing, proper quarantining, advice to the chain of command.

- Specific Objectives could include:
• Recognize the suspected patients early and rapidly
• Apply appropriate source control
• Apply routine Infection Prevention and Control (IPC) for all patients
• Collaborate and communicate with the health care facility's IPC infrastructure
• Apply standard precautions according to presumed diagnosis at all times
• Perform a primary assessment of a patient with suspected acute respiratory infection
• Distinguish between severe acute respiratory infection and acute respiratory infection
• Obtain specimen for laboratory test according to safety procedures
• Triage the patient according to the general principles for patients with suspected COVID-19 infection
• Obtain patient history on close contacts (berthing mates, co-workers, etc.)
• Advise on requirement for patient to quarantine
• Coordinate safe patient transfer
• Doff PPE according to procedure

	D	**H** Anxious, fatigued, can take oral fluids and meds
	E	**E** No signs of trauma, skin warm, no skin rashes

A	None
M	Motrin every 4-6 hours by mouth as needed
P	History of lower back pain
L	Breakfast using MRE - omelet, sausage, coffee
E	
C	Anxious
R	Slightly elevated for the past 2-3 hours
E	Conjunctival injections, pupils normal and reactive
S	Warm
S	Fast pulse, fever

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Non-applicable. Patient was in quarters and walked over to the MTF

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
120	125	80	22/min	95%		3	5	6	

List of injuries (or disease findings):

- No injuries
- See History of presenting illness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-14:00H	Returned from routine patrol, felt well
-3:00H	Started to feel feverish, sluggish, with myalgia and chills
0:00H	Arrives at MTF and triaged. Informed chain of command of possible biological attack or accidental exposure on patrol
+1D	Feeling better, fever managed by cold compresses, acetaminophen, oral fluids, reduced cough, no sporadic nausea and vomiting (wants to get back to work)
+2D	Discharged with limitations on activity for 1 week, still has mild cough, fatigue and anorexia Told to return to MTF if symptoms persist or get worse.
+3D	Patient for follow-up

EXPECTED OUTCOME OF CASE

Progressive recovery with appropriate supportive care with follow-up

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- Blood cultures: pending
- PCR / immunoassay obtained from a nasal swab: positive for enterotoxin B (available in 24 hours)
- EKG: normal sinus rhythm (if ordered)
- CBC:
  - WBC: 15.6k
  - Hb: 14.4 g/dL
  - Hct: 47.3%
  - Plts: 192k
	- Chest X-ray (AP and lateral): normal	

ADDITIONAL COMMENTS including Moulage Information

Patient is likely "non-contaminated" given that exposure would have occurred 8-20 hours prior to the onset of symptoms. Conversely, if the victim had not showered or changed clothes during the intervening timeframe, it is possible that resudual toxin on clothing may pose some risk to treating personnel.

S	Fast pulse, fever

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Role 1 Treatment
- Non-steroidal anti-inflammatory for muscle / joint pain (e.g. Motrin)
- Oxygen
- Transported from Role 1 to Role 2 due to concerns over oxygen saturation and progression

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
140	110	70	28/min	88%		3	4	6	

List of injuries (or disease findings):

- No injuries
- See History of presenting illness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-1D	Returned from routine patrol, felt well
-3:00H	Started to feel feverish, sluggish, with myalgia and chills
0:00H	Presented to Role 1. Decision to transport to Role 2. Arrives at MTF and triaged. Informed chain of command of possible biological attack or accident exposure on patrol
+12:00H	Decision to transport patient to Role 2 by road ambulance
+14:00H	Arrives at Role 2. During MEDEVAC, patient's condition started to deteriorate
+16:00H	Patient nonresponsive to supportive treatment, continues to deteriorate, developing worsening hypoxemia and tachypnea
+18:00H	Develops signs and symptoms of ARDS, with hypotension, hypoxaemia and, ultimately, collapse

EXPECTED OUTCOME OF CASE

Death despite intensive therapy with oxygen then with ventilation/intubation, broad spectrum antibiotics and fluids. Role 1 checks the condition of the other members of the patrol. Role 2 asks for updates from Role 1. Takes steps to safely transport the body back to Role 4 (home country).

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- Blood cultures: pending
- EKG: sinus tachycardia
- PCR / immunoassay obtained from a nasal swab: positive for enterotoxin B (results after death)
- CBC:
  - WBC: 17.2k
  - Hb: 13.9 g/dL
  - Hct: 45.2%
  - Plts: 213k
	- Chest X-ray (AP and Lateral): patches of pulmonary edema and Kerley's B lines suggesting interstitial edema	

ADDITIONAL COMMENTS including Moulage Information

Patient is likely "non-contaminated" given that exposure would have occurred 8-20 hours prior to the onset of symptoms. Conversely, if the victim had not showered or changed clothes during the intervening timeframe, it is possible that residual toxin on clothing may pose some risk to treating personnel.

Moulage: feverish

C	**C**	IV fluids may be administered
D	**H**	Severe
E	**E**	N/A

A	No known allergies
M	None (malaria prophylaxis in some scenarios)
P	Generally healthy active duty servicemember
L	Garrison meals yesterday; vomiting and loss of appetite today
E	Awoke this morning with shaking chills and a severe headache.
C	Listless, exhausted
R	Mild tachypnea related to fever
E	Normal
S	Dry mucous membranes
S	Normal

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

Acetominophen or Ibuprofen may be provided for fever and pain.
IV fluids may be adminstered.
No other treatment is necessary prior to arrival at MTF.

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
102*	115	65	25	96%	Alert	4	4	6	

List of injuries (or disease findings):

*HR might be lower (84) if IVFs had been administered.

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

First 48 hours	Fevers, rigors, headache, backaches persist.
D+2	Erythematous macules are noted on face, hands, forearms.
D+3	Macules (which are now prominent on the lower extremities as well as the upper) have become papules and spread to the trunk.
D+4	Papules have become vesicles.
D+5, D+6	Vesicles have become purulent, then tense and extremely painful. Fever, which may have abated somewhat over past few days, again spikes to 40C (104F).
D+7	Vesicles are widespread over entire body, including tongue and mucous membranes, and appear umbilicated.
D+9	Vesicles begin to form scabs; fever breaks.
D+28	Last scabs have separated, leaving widespread scars.

EXPECTED OUTCOME OF CASE

Survival with widespread scarring after a prolonged (month-long) course.
Tecoviramat might be administered upon recognition of the appropriate diagnosis. The medication may be difficult to procure; arrangements for procural should me made ASAP.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**
CBC (if obtained): 11.2k WBC with 10% PMNs; H/H = 14.2/46.6; platelets = 117k.	No imaging is required. A CXR, if obtained, is normal.	

ADDITIONAL COMMENTS including Moulage Information

Patient is condsidered "non-contaminated" given that exposure would have occurred ~10-14 days prior to the onset of symptoms.

No moulage is necessary initially, but widespread macules/papules/vesicles/scabs might be simulated in later stages of disease.

140	106	65	28/min	92%	Alert	4	5	6	Temp 36.3C

List of injuries (or disease findings):

- No injuries
- See History of presenting illness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-7:00H	Returned from routine patrol, felt well.
-4:00H	Onset of nausea, vomiting, diarrhea, shortness of breath.
0:00H	Arrives at MTF and triaged. Informed chain of command of possible biological attack or accidental exposure on patrol. Oxygen continued, eyes patched after copius irrigation and administration of ophthalmic anaesthetic drops.
+24:00H	Eye patches removed; eyes remain red (conjunctival injection) but less painful.
+3D	Oxygen slowly weaned; patient feeling better, oral fluids tolerated, sporadic nausea and vomiting slowly improving, skin remains erythematous and irritated, with numerous blisters.
+5D	Discharged with limitations on activity for 1 week, still has mild cough, fatigue, anorexia. Told to return to MTF if symptoms persist or worsen.

EXPECTED OUTCOME OF CASE

Progressive recovery with appropriate supportive care with follow-up. Skin lesions may take 2 weeks to resolve.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- Blood cultures: pending
- Urine assay for T-2 mycotoxins can be sent to USAMRIID or other national reference laboratories; results would not likely be available in time to make clinical decisions
- EKG: normal sinus rhythm (if ordered)
- CBC (on admission)*:
  - WBC: 10.2k with 37% PMNs
  - Hb: 15.7 g/dL
  - Hct: 50.1%
  - Plts: 278k
 	
*T-2 exposure leads to bone marrow suppression; CBCs obtained later in the course of illness would likely reveal lower WBC counts, platelet counts, and Hb/Hct.
	- Chest X-ray (AP and lateral): normal	

ADDITIONAL COMMENTS including Moulage Information

T-2 is not contagious. However, its very short latent period (2-4 hours in most cases, less in case of a heavy exposure) dictates that victims may present shortly after exposure, when active toxin may still be present on their person and clothing.

- Detection: the main core competency is high index of suspension for some form of Bio attack after assessing the patient.

S	Redness of exposed facial area

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

- Eye irrigation with normal saline
- Exposed area decontamination with RSDL
- Original clothing and gear removed and sealed

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
132	100	70	32/min	88%	Verbal	3	4	5	

List of injuries (or disease findings):

- No injuries
- Transfered from FOB with aid station by road ambulance
- During trip, patient's condition began to deteriorate
- Management received before arrival at MTF: immediate removal from area and decon; IV 1 litre normal saline bolus then 500cc/hr
- Oxygen 5 liters by mask
- No medications or other medical countermeasures given

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-3:00H	On patrol - encountered "white fog" from routine patrol [story can be changed by MEL/MIL scripter]. Immediate eye irritation and cough.
-2:45H	Rapid evacuation; eye irrigation; clothing removal and decon of exposed areas.
-2:00H	Arrived at aid station and triaged. Skin redness (unexposed area), sore throat and worsening eye irritation. Informed chain of command of possible biological attack or accidental exposure on patrol. Transferred to MTF (Role 2) as a cautionary measure.
0:00H	At MTF - increasing dyspnea, wheezing; stomach pain with associated vomiting and diarrhea. Given Ciprofloxacin 400mg iv every 8 hours and Clindamycin 900mg iv every 8 hours on spec.
+12:00H	Despite supportive therapy, symptoms progress noted by increasing heart rate, hypothermia, hypotension, and bloody diarrhea.
+16:00H	ARDS, hypotension, hypoxemia and collapse.

EXPECTED OUTCOME OF CASE

Death despite intensive therapy with oxygen then with ventilation/intubation, broad spectrum antibiotics and fluids. Role 1 checks the condition of the other members of the patrol. Role 2 asks for update from Role 1. Takes steps to safely transport the body back to Role 4 (home country).

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- CBC:
  - WBC: 12.6k with 39% PMNs
  - Hb: 14.8 g/dL
  - Hct: 46.7%
  - Plts: 234k
- Arterial blood gas:
  - pH: 7.32
  - pO2: 85 kPa
  - pCO2: 19 kPa
- Blood for cultures and PCR
- Serum for serologic studies
- Sputum for bacterial cultures
- Blood / urine for toxin assay
- Throat swab for viral culture
- Throat swab for PCR / ELISA
- Stool sample for culture
- Stool sample for O & P
- Vital signs monitoring
- EKG: sinus tachycardia
	- Chest X-ray: diffuse interstitial infiltrates	

ADDITIONAL COMMENTS including Moulage Information

T-2 is not contagious. However, its very short latent period (2-4 hours in most cases, less in case of a heavy exposure) dictates that victims may present shortly after exposure, when active toxin may still be present on their person and clothing.

Agent is unknown but high probability of biological / toxin attack; Requires stepwise approach to a potential biological casualty.
1. Maintain a healthy index of suspicion
2. Protect your self (must be assessed for the entire initial exposure, first aid, transport & MTF)
3. Save patient's life
4. Disinfect or decontaminate as appropriate
5. Establish diagnosis (if possible) - may need to treat empirically
6. Provide prompt therapy (this be empirically for suspected BW along with supportive therapy)
7. Institute proper infection measures
8. Alert proper authorities
9. Epidemiological investigation / Manage psych after math of BW attack
10. Maintain a level of proficiency

REF: Lenhart M.K. et al. (2007) Medical Aspects of Biological Warfare. Office of the Surgeon General, Department of the Army, Falls Church, Virgina) USA.

KEY POINT for this scenario is to treat empirically based on presumption of a BW attack

M	Acetaminophen every 4-6 hours for 12 hours, vitamins
P	Generally healthy, nonsmoker
L	1 day ago - breakfast only. Has not eaten since (no appetite)
E	Initially seen by HCP and diagnosed with flu (dry cough, fatigue, fever) given bed rest in quarters, push oral hydration. If no improvement, follow up in 2 days
C	Awake, alert, but looks unwell
R	Difficulty breathing at rest, progressively worse over the past 2 to 3 days
E	Pupils normal and reactive
S	None
S	Dry, warm

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

- Acetaminophen for fever (e.g. Tylenol)
- Directed by supervisor to go to sick call work space because he appeared unwell (fatigued, visible sweating)

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
122	110	68	30/min	92%	Alert	4	5	6	Temp 39.2C

List of injuries (or disease findings):

- No injuries
- Malaise and anorexia for 2 to 3 days
- Cough (non-productive)
- Chest pain particularly on inspiration
- Moderate headache

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-48:00H	Woke up feeling unwell, cough, sweating, poor appetite. Seen by HCP and diagnosed with flu. Discharged to quarters for rest and oral hydration. Patient was able to isolate. To return in 2 to 3 days if worsening symptoms.
-24:00H	Cough becoming worse, with accompanying shortness of breath, no appetite, fever (treated with acetaminophen).
0:00H	Returned to clinic - with symptoms worsening over past 48 hours. Masked, started on supplemental oxygen by mask and placed in isolated room and referred to physician.
+0:10H	Alert and oriented X 3 - looks unwell. Complete history and physical. Orthostatic hypotension, tenting of skin, nonproductive cough, malaise, bilaterally axillary lymphadenopathy, no skin lesions, pupils equal and reactive, mouth dry, no secretions.
+0:15H	IV X 2 (one TKVO other for normal saline 200 to 250cc bolus then 100cc/hr). Screening and tests ordered: CBC differential, blood and sputum cultures, electrolytes, liver function tests, BUN, creatinine, Gram stain, chest X-ray AP and lateral (CT unavailable).
+0:30H	CBC shows elevated white count, Gram stain of sputum shows short gram-negative rods. CXR bilateral hilar lymphadenopathy and patchy infiltrates.
+0:40H	Started on IV gentamicin 5mg/kg every 8 hours for 7 to 10 days. Monitoring and continue with supplemental oxygen and antipyretic. Consult ID expert and prepare patient for transfer to hospital setting.
+1:00H	Medical staff informs chain of command of the situation. Consider tularemia as likely diagnosis, attempt to identify source (endemic exposure or bio-terrorist attack).

EXPECTED OUTCOME OF CASE

Progressive recovery requiring supportive, monitoring, iv antibiotics (primary gentamicin or streptomycin) for severe illness. Consider ciprofloxacin 500mg orally for 12 hours as pre- and post-exposure medical countermeasure.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- CBC:
  - WBC: 18.7k with 72% PMNs
  - Hb: 15.2 g/dL
  - Hct: 49.9%
  - Plts: 213k
- Gram stain of sputum: tiny gram-negative coccobacilli
- Electrolytes: normal
- Liver function: normal
- Renal function: normal
- O2 sat: 92% (94% on oxygen)
- EKG: sinus tachycardia (if ordered)
	- Chest X-ray (AP and lateral): pleural exudative effusions with bilateral hilar adenopathy and infiltrates	

ADDITIONAL COMMENTS including Moulage Information

Patient is considered "non-contaminated" given that exposure would have occurred 2-7 days prior to the onset of symptoms.

The main core competency is high index of suspicion for tularemia as part of a broader differential diagnosis. Also, the presentation of pneumonic tularemia is nonspecific and could be caused by a number of infectious agents (e.g. tuberculosis).

The healthcare team should be able to put some key findings together to help rule out other causes of pneumonia such as non-productive cough along with bilateral auxiliary tender and enlarged lymph nodes, chest X-ray findings, positive Gram stain, and fever.

Information to the chain of command and professional technical network. Consideration of use of medical countermeasures available etc.

- Nil

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
124	106	64	34/min	86%	Alert	3	4	5	Listless

List of injuries (or disease findings):

- No injuries
- Malaise and anorexia X 24 hours
- Cough (non-productive)
- Chest pain particularly on inspiration
- Bilateral axillary lymphadenopathy
- Moderate headache

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

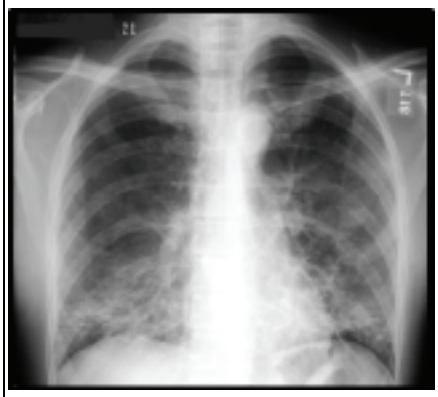
-24:00H	Woke up feeling unwell, cough, sweating, poor appetite. Rapidly worsening over the day. Brought to clinic by 2 tent mates as patient was very drowsy, difficult to wake and to bring to the clinic
0:00H	Presents cyanotic, drowsy, and disoriented, with significant respiratory related symptoms and signs. Given anti-pyretic and started on IV hydration (e.g. normal saline 200 to 250cc bolus then 100cc/hr). Triaged to critical care, isolated and started on supplement oxygen by nasal-prongs
+0:05H	Drowsy & disoriented - looks unwell, febrile. Rapid and focused history and physical. Orthostatic hypotension, nonproductive cough, malaise, bilaterally axillary & submandibular lymphadenopathy, no skin lesions, pupils equal and reactive, mouth dry, no secretions.
+0:10H	Start second IV. Screening and tests ordered: CBC differential, blood and sputum cultures, arterial blood gas, electrolytes, INR, PT aPTT, D-dimer, liver function tests, BUN, creatinine, Gram stain, chest X-ray AP and lateral (CT unavailable). Monitor vitals, O2 sats, EKG
+0:15H	Patient rapidly becomes less responsive (GCS = 9). Patient is intubated and ventilated using rapid induction protocol. Blood gases are abnormal (showing respiratory acidosis and O2 sat 88%). NG tube and urinary catheter inserted
+0:30H	Initial CBC shows elevated white count with leukocytosis. Gram stain shows short gram-negative rods. CXR: lower lobe bilateral consolidation, hilar lymphadenopathy. Started on broad spectrum antibiotics (e.g. carbapenem, piperacillin-tazobacta) and if tularemia suspected started on IV gentamicin 7mg/kg every 8 hours for 14 days. Also suspect early sepsis.
+1:00H	Despite adequate fluid resuscitation, BP drops 80 mmHg/pulse, MAP < 70 mmHg. Urine output has decreased. Arterial line inserted with difficulty. Started IV vasopressors (i.e. norepinephrine)
+3:00H	Despite efforts, there are increasing signs of end-organ failure (e.g. decrease to no urine output), central cyanosis, cool skin patient, increased hypotension despite use of vasopressors.

EXPECTED OUTCOME OF CASE

Despite efforts, patient dies. Medical staff turn attention to epidemiological investigation. The constitution of signs and symptoms suggest pneumonic tularaemia. Medical staff informs chain of command of the situation, search for additional cases begins in earnest.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- CBC:
  - WBC: 21.2k with 81% PMNs
  - Hb: 13.4 g/dL
  - Hct: 39.7%
  - Plts: 88k
- Arterial blood gas:
  - pH: 7.28
  - pO2: 84 kPa
  - pCO2: 29 kPa
  - HCO3: 18 mmol/L
- Serum lactate: 5.5 mmol/L
- Gram stain of sputum: tiny gram-negative coccobacilli
- Electrolytes:
  - Na: 137 mmol/L
  - K: 3.9 mmol/L
  - Cl: 104 mmol/L
  - HCO3: 17 mmol/L
- Liver function:
  - Alk phos: 136 U/L
  - SGOT: 44 U/L
- Renal function:
  - BUN: 43 mg/dL (15.4 mmol/L)
  - Creatinine: 1.2 mg/dL (0.43 mmol/L)
- O2 sat: 90% but falls as patient decompensates
- EKG: sinus tachycardia transitioning to bradycardia and asystole
	Chest X-ray: bilateral lower lobe pneumonia
	 	



ADDITIONAL COMMENTS including Moulage Information

Patient is considered "non-contaminated" given that exposure would have occurred 2-7 days prior to the onset of symptoms.

The main core competency is high index of suspicion for tularaemia as part of a broader differential diagnosis. Also, the presentation of pneumonic tularemia is nonspecific and could be caused by a number of infectious agents (e.g. tuberculoses).

The healthcare team should be able to put some key findings together to help rule out other causes of pneumonia such as non-productive cough along with bilateral auxiliary and submandibular tender and enlarged lymph nodes, chest X-ray findings, gram stain, and fever.

Identify sepsis and treat appropriately; this scenario could be played such that prompt recognition and institution of appropriate antibiotic therapy might lead to survival.

Information to the chain of command and professional technical network. Consideration of use of medical countermeasures if available etc.

After action with staff for review of case, discuss emotions and watch for signs of mental distress.

L	Yesterday had supper, no breakfast meal today
E	
C	Drowsy, disoriented, no seizures, GCS = 12 (responds to speech, confused, moves with pain)
R	Mildly tachypnic, O2 sat normal
E	Conjunctival Injections, Pupils normal and reactive
S	Normal
S	Hot, diaphoretic

FIRST AID / TREATMENT GIVEN BEFORE ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

- Acetaminophen or NSAID for fever and myalgia
- IV fluids (crystalloid)

OBSERVATIONS ON ARRIVAL AT MEDICAL FACILITY (AS REQUIRED)

HR	NIBP		RESP	SATS	AVPU / GCS (EVM)				OTHER
120	114	77	20/min	96%	Verbal	3	4	5	Temp: 39.7C; drowsy

List of injuries (or disease findings):

- No injuries
- Malaise and anorexia for greater than 12 hours
- Initially presented more alert (at other medical facility) complaining of photophobia, headache, and mild neck stiffness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-24:00H	Woke up feeling unwell, headache and photophobia, sweating, poor appetite. Went to see MO at Role 1 facility. Admitted for observation. Within about 12 hours, patient began to be confused, somnolent, and more lethargic. Decision to send to multinational Role 2.
0:00H	Presents drowsy and disoriented, febrile with neck pain/stiffness. At Role 1, given anti-pyretic and started on IV hydration (e.g. normal saline 200 to 250cc bolus than 100cc/hr).
+0:05H	Drowsy & disoriented - looks unwell, febrile. Rapid and focused history and physical - febrile, no skin lesions, pupils equal and reactive, mouth dry, no secretions.
+0:10H	Screening tests may be ordered: CBC differential, blood for cultures, and serum for toxin assays and pathogen identification. Electrolytes, INR, PT aPTT, liver function tests, BUN, creatinine, urine sample. Chest X-ray AP and lateral, CT of head (if available, to rule out space occupying lesion). Monitor vitals, O2 sats, EKG. CSF opening pressure, CSF for analysis including PCR to rule out other pathogens (e.g. CSF PCR HSV-1, HSV-2, and enteroviruses).
+0:15H	Patient may be started empirically on antivirals (e.g. acyclovir) and broad spectrum antibiotics.
+24:00H	Patient remains febrile but stable. Disorientation has resolved. Antivirals and antibiotics may be continued pending definitive diagnosis.
+48:00H	Considerable improvement. Continued monitoring. Physical exam shows normal cranial nerves, mild muscle weakness. Concomitant investigation of possible exposure , and monitoring for other casualties. Chain of command informed of clinical suspicion and patient status.
short term	Eventually patient returned to normal and was able to join his section. All samples were sent to Role 3 for further analysis. There is a high degree of certainty that the soldier was exposed alphavirus. Vaccination status was confirmed against alphaviruses.

EXPECTED OUTCOME OF CASE

Patient has full recovery. No neuropathology sequelae were noted.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

If ordered:
 	
- CBC:
  - WBC: 4.7k with 26% PMNs
  - Hb: 15.7 g/dL
  - Hct: 48.1%
  - Plts: 182k
- CSF:
  - Opening pressure: 22 cm H2O
  - WBC: 17
  - Protein: 156 mg/dL
  - Glucose 52 mg/dL
- Serology: within a month the hemagglutination inhibition assay (HAI) for VEEV confirmed diagnosis
	If ordered:
	
	- CXR: normal
	- CT scan of head: normal	

ADDITIONAL COMMENTS including Moulage Information

Patient is "non-contaminated" given that exposure would have occurred 2-6 days prior to the onset of symptoms.

The main core competency is to identify a biological syndrome and management of an encephalitic syndrome, but also the need to rule out sepsis. This includes steps to rule out and treat empirically possible infectious agents and identifying sepsis early. Early presentation of sepsis includes: blood pressure (BP) < 100 or lack of radial pulse (suggestive of septic shock); respiratory rate > 22 breaths per minute; altered mental status; and non-blanching rash, decreased capillary refill or skin mottling.

EEE/WEE Non-Encephalitic Survivor

- Appears unwell
- Malaise and anorexia for greater than 12 hours
- Headache (no neck stiffness)
- Neuro exam: normal with the exception of listlessness and diminished responsiveness

CLINICAL TIMELINE using relative time to event i.e. +1:00H or +1D

-12:00H	Woke up feeling unwell, headache, fever, muscle pain and lethargy.
0:00H	On presentation, fever, headache for 12 hrs, muscle aches, lethargy, nausea. Focused, physical exam (neuro, respiratory) within normal limits except for listlessness and diminished responsiveness.
+0:20H	Place on acetaminophen and in observation until fever resolves. Routine blood and urine analysis. Blood sample for rapid diagnostic test (RDT) and blood smear ordered to rule out malaria (likely P. Vivax).
+1:00H	Febrile, remaining vital signs normal, feeling better after successful oral hydration.
+12:00H	Discharge from medical unit - provided medical restrictions due to fatigue. Directed to return if symptoms persist or get worse. Headache and fatigue persists.
+2 weeks	Headaches, fatigue, emotional lability may last for months; patient evacuated due to anticipated prolonged recovery period.

EXPECTED OUTCOME OF CASE

Patient has full recovery.

ASSOCIATED PATIENT INVESTIGATIONS including File Reference Format (e.g. 1A-Lab001)		
Laboratory	**Diagnostic Imaging**	**Photos and Other Details**

- CBC:
  - WBC: 4.8k with 20% PMNs
  - Hb: 15.1 g/dL
  - Hct: 44.7%
  - Plts: 161k
- Blood smear: normal
- RDT: negative		

ADDITIONAL COMMENTS including Moulage Information

Patient is "non-contaminated" given that exposure would have occurred 4-5 days prior to the onset of symptoms.

The main core competency is to consider alphavirus (WEEV is endemic in Brazil) in the differential diagnosis for fever and malaise in someone working and training in hot, humid climate near swampy areas. Also, while in observation, the patient should be monitored for early sepsis that includes the following: blood pressure (BP) < 100 or lack of radial pulse (suggestive of septic shock); respiratory rate > 22 breaths per minute; altered mental status; and non-blanching rash, decreased capillary refill or skin mottling.

14. ABSTRACT

This handbook provides individuals who plan and execute NATO exercises with the resources to accomplish cross-disciplinary chemical, biological, radiological, and nuclear (CBRN) defence and medical training, whether or not CBRN medical support is a primary focus of the exercise. For such training to be successful, a level of CBRN medical expertise is required for certain exercise planning tasks, but the individuals responsible for those tasks are often experts in areas other than CBRN medical support and lack ready access to CBRN medical expertise. To address this need, this handbook provides exercise planning materials created by CBRN medical subject matter experts to assist non-experts in exercise development. This handbook combines information on the NATO exercise process described in Bi-Strategic Command Collective Training and Exercise Directive 075-003 with information from NATO CBRN defence doctrine and NATO medical support doctrine. It also informs readers of the relevant exercise support functions, courses and training events, and lessons learned roles of NATO's Centres of Excellence in CBRN defence and military medicine.

15. SUBJECT TERMS

Exercise, handbook, training, CBRN, medical, NATO
